Ecology And Conservation Of Fishes

Synopsis

Written as a stand-alone textbook for students and a useful reference for professionals in government and private agencies, academic institutions, and consultants, *Ecology and Conservation of Fishes* provides broad, comprehensive, and systematic coverage of all aquatic systems from the mountains to the oceans. The book begins with overview discussions on the ecology, evolution, and diversity of fishes. It moves on to address freshwater, estuarine, and marine ecosystems and identifies factors that affect the distribution and abundance of fishes. It then examines the adaptations of fishes as a response to constraints posed in ecosystems. The book concludes with four chapters on applied ecology to discuss the critical issues of management, conservation, biodiversity crises, and climate change. Major marine fisheries have collapsed, and there are worldwide declines in freshwater fish populations. Fishery scientists and managers must become more effective at understanding and dealing with resource issues. If not, fish species, communities, and entire ecosystems will continue to decline as habitats change and species are lost. *Ecology and Conservation of Fishes* has taken a historical and functional approach to explain how we got where we are, providing old and new with a better foundation as ecologists and conservationists, and most importantly, it awakens senses of purpose and need. Past management practices are reviewed, present programs considered, and the need for incorporating principles of applied ecology in future practices is emphasized.

Book Information

Hardcover: 573 pages

Publisher: CRC Press; 1 edition (October 19, 2011)

Language: English

ISBN-10: 1439858543

ISBN-13: 978-1439858547

Product Dimensions: 7 x 1.3 x 10.1 inches

Shipping Weight: 2.6 pounds (View shipping rates and policies)

Average Customer Review: 5.0 out of 5 stars 1 customer review

Best Sellers Rank: #893,356 in Books (See Top 100 in Books) #130 in Books > Science & Math > Biological Sciences > Zoology > Ichthyology #358 in Books > Science & Math > Biological Sciences > Biology > Marine Biology #745 in Books > Textbooks > Science & Mathematics > Biology & Life Sciences > Ecology

Customer Reviews

"Overall, this volume offers a very good overview of issues that are now critically important in efforts to maintain both fisheries and the ecosystems that support them and in the efforts to maintain biodiversity. | the examples provided and the overall depth of coverage, along with the engaging writing style, combine to make this a very readable and informative book." •Susan A. Foster and John A. Baker, Clark University, Worcester, Massachusetts, *The Quarterly Review of Biology*, Vol. 89, No. 1, 2014 "Tyus (emer., Univ. of Colorado at Boulder) attempts to better educate future fisheries managers and to infuse classic ecological concepts into modern fisheries management. ...The author writes in a clear, concise manner and includes case studies to illustrate real-world lessons learned. Because of the content, this book is more appropriate for upper-division or graduate-level courses. However, it could be used in a variety of courses, including environmental science, fish and fisheries science, biology, ecology, and ichthyology.Â Recommended." •K. R. Thompson, Ozarks Technical Community College, in *CHOICE*, May 2012 "Overall, I find the approach to the subject very comprehensive and pedagogically user-friendly for introductory courses in Ecology and Conservation of Fishes. Dr. Tyus has brought his decades of experience to bear on this fine piece of work in a style that should appeal to students, instructors, and professionals." •Emmanuel A. Frimpong, Ph.D., Assistant Professor, Department of Fisheries & Wildlife Sciences, Virginia Polytechnic Institute and State University "The contents of a book do not always match the title of the book, but from what I read, this one does so magnificently. Dr. Tyus's early training in academia, his many years in active fisheries field research experiences, combined with his familiarity with the literature, followed by several successful years of teaching at the University of Colorado, Boulder, since his retirement from the U.S. Fish and Wildlife Service, make this book unique among other texts or references. Moreover, his organization of and within each chapter is excellent, providing for very interesting reading. The full color plates add great interest to this fine text/reference." •Walter R. Courtenay, Jr., Ph.D., Professor Emeritus of Zoology, Department of Biological Sciences, Florida Atlantic University " | has taken a historical and functional approach to explain how we got where we are, providing old and new with a better foundation as ecologists and conservationists, and most importantly, it awakens senses of purpose and need. Past management practices are reviewed, present programs considered, and the need for incorporating principles of applied ecology in future practices is emphasized. Includes a 16-page, full-color insert featuring 141 figures, as well as a glossary, a lexicon of Greek and Latin word roots, and an appendix on fish identification to help students master the text material." •Northeastern Naturalist, December 2012

Harold M. Tyus is Emeritus Research Scientist at the Center for Limnology, Cooperative Institute for Research in Environmental Sciences, University of Colorado at Boulder, where he taught Ecology of Fishes in the Department of Ecology and Evolutionary Biology. He also is an Adjunct Professor of Environmental Policy and Management at the University of Denver, where he teaches and serves as a faculty advisor. Dr. Tyus received his academic training in the Department of Zoology at North Carolina State University, with the aid of a National Science Foundation fellowship and a scholarship from the National Wildlife Federation. He also was affiliated with the North Carolina Cooperative Fishery Unit, earning an MS studying sunfish phylogenetics and a Ph.D. studying population dynamics and migrations of river herring. His minor concentration was in water resources management. Dr. Tyus is a retired researcher and manager for the U.S. Government, serving 23 years with the Army Corps of Engineers and Fish and Wildlife Service. During that time he was involved with environmental impact assessment and studied a wide variety of aquatic habitats, fishes, and human-induced changes in waters of the United States, from east coast oceans, estuaries and wetlands to southwestern desert rivers. He has written and edited numerous scientific papers on fishes and government documents on fish ecology and conservation, including listing and recovery plans for Endangered Species. He was a member of the Colorado River Fishes Recovery Team for 12 years, and he has been a consultant and science advisor for industry and government. His professional affiliations include the Desert Fishes Council, the American Society of Ichthyologists and Herpetologists, and the Society for Conservation Biology. He is a Fellow of the American Institute of Fishery Research Biologists and a life member of the American Fisheries Society, which has certified him as a Fishery Scientist and Fisheries Professional.

Great condition, no complaints. Thanks!
